Professional Summary

Full-stack developer with a track record of architecting production-grade applications, including real-time collaborative platforms and AI-driven recruitment agents. Proven ability to optimise performance and scalability through containerised deployments, robust CI/CD pipelines using GitHub Actions, and microservice architecture-based projects. Skilled in system design fundamentals, version control best practices, and technical communication. Committed to delivering high-impact, user-centric software solutions using a modern stack of TypeScript, Next.js, and AWS.

Education

JC BOSE UNIVERSITY OF SCIENCE AND TECHNOLOGY , YMCA – Faridabad 7.98 GPA **June 2026**
Computer Engineering

Projects

CollabxDraw - RealTime Collaborative Whiteboard 08 Feb 2026 – Present

- **Technologies:** React, Express.js, WebSockets, Docker, CI/CD pipelines, Nginx, AWS, Vercel
- Built production-grade collaborative whiteboard enabling real-time multi-user drawing with WebSocket-driven updates.
- Engineered dual-backend architecture: Express REST API for auth and room management, WebSocket server for live event broadcasting.
- Optimized load time by pre-fetching canvas state over HTTP, eliminating blank-canvas flicker on room join.
- Containerized services with multi-stage Docker builds; deployed frontend via Vercel for consistent environments.

Avni - AI Recruitment Agent 02 Feb 2025 – 23 May 2025

- **Technologies:** LangChain, VectorDB, OpenAI API, Streamlit, Docker, AWS
- Built AI recruitment agent that scores resumes against job descriptions and generates optimized rewrites.
- Implemented RAG pipeline with LangChain + FAISS: semantic similarity search for context-aware scoring.
- Designed LLM chain to extract skills from job descriptions and match against candidate resumes for automated fit scoring.
- Generated personalized interview questions tailored to each candidate's strengths and weaknesses.
- Delivered paragraph-level resume feedback with before/after rewrites and gap-filling regeneration feature.

OwnShell - Custom Unix Shell Interpreter 13 March 2026 – Present

- Developed a custom Unix shell interpreter from scratch, implementing core OS concepts including process management, command parsing, I/O redirection, and environment variable handling.
- Built a custom command tokenizer and argument parser without shell libraries, handling edge cases in argument splitting and command dispatch for enhanced reliability.

Skills

Languages: TypeScript, Python, JavaScript, SQL, HTML/CSS

Frontend: React, React Router, Next.js

Backend: Node.js, Express.js, WebSockets, REST APIs, FAST API

AI/ML: LangChain, OpenAI APIs, FAISS, RAG

Databases: PostgreSQL, MongoDB, MySQL

DevOps/Tooling: Docker, Turborepo, pnpm, Git, AWS, Linux, CI/CD

Certifications

AI Engineer for Developers Associate Certification – DataCamp
